Education

People's Security Academy

Bachelor of Science in Information Technology. GPA: 3.02/4.

Sep 2015 – Sep 2019

Ha Noi, Viet Nam

Projects

Graduation thesis | *Python*

June 2019

- Researched the application of the OPEN AI GLOW network to customize object images to support investigation work.
- Libraries: TensorFlow, cv2, PIL, numpy, dlib, imutils. Model: Pre-trained with European portrait images dataset.
- Work done: Collect portrait images from Google Image using google_images_download library; Compare normal images (pixel adjustment) and images created from GLOW model; Apply the model to Vietnamese portrait images dataset. More effective with specific attributes such as hair color, age, etc.
- Applied to investigation work: Create people's images by describing specific characteristics and then customize them.

Vietnamese virtual assistant | *Python*

August 2020

- Designed virtual assistant to listen, speak, and execute commands in Vietnamese language.
- Libraries: speech_recognition, wikipedia, webbrowser, smtplib, selenium, gtts, youtube_search, ...
- Virtual assistant can do: Greetings; Display time; Open website, application; Search on Google; Send email; Weather forecast; Play music video; Change desktop wallpaper; Read news today; Answer concepts.
- Disadvantages: The bot doesn't understand the meaning of questions and has to use if else structure to classify.

Fullstack programming of social network website e-network | *Javascript*

June 2021

- Model: MERN (MongoDB, ExpressJS, ReactJS, NodeJS)
- Website features: Login/Register account; Add, edit, delete posts; Show notifications; Show personal page; Follow/Unfollow other people's posts; Comment on posts; Search for users; Chat between two users: Message, voice call, video call.

Game Friday Night Funkin tool programming | *Python, C++*

January 2022

- Game title with multiple versions. Each version has multiple songs. When a song is selected, the screen displays the keys to press or hold when a key touches a line. Each song has a mod song (in json file format) that stores song information and a list of keys to press or hold at a specific time.
- Program a tool to read mod songs to automatically press or hold keys accurately for winning with the highest score.
- Libraries: pyautogui, directkeys, PyQt5, concurrent.futures.
- Bot key miss rate according to song complexity level: Easy level: 0%, Medium level: 3%, Hard level: 10% or more leading to game loss.
- Reason: Time for the computer to automatically type keys is about 0.1s. Multithreading in Python is not effective.
- Upgrade the tool by rewriting it using C++ language which solves the above problem.

Twitter tool programming | *C#*

February 2022

- Library: Selenium.
- Receive input as a list of accounts, Twitter post links to open the browser including the profile available in the account folder, access the link to perform commands such as like, share, follow, comment, retweet, quote tweet posts.

- Using Mouse Hook and Keyboard Hook.
- Simulate operations of multiple browsers according to the first opened browser (similar to LDPlayer for android).
- Disadvantage: Unable to operate multi-cursors simultaneously.

Technical Skills

Languages: Python, Java, C++, C#, HTML/CSS, JavaScript

Databases: MySQL, MongoDB

Operating systems: Linux, Windows

Others: Knowledge of data structure and algorithm. Proficient in OOP.

Awards

2015: Third Prize in the National Mathematics Olympiad for 12th grade students.

2016: Third Prize in the National Mathematics Olympiad for university students.

2016: Consolation Prize in the National Computer Science Olympiad for university students.

2017: First Prize in the National Mathematics Olympiad for university students.

2017: Third Prize in the National Computer Science Olympiad for university students.

2018: First Prize in the National Mathematics Olympiad for university students.

2019: Second Prize in the student scientific research competition organized by the People's Security Academy.
